

**BIMM 143**  
**Structural Bioinformatics II**  
**Lecture 12**  
**Barry Grant**  
UC San Diego  
<http://thegrantlab.org/bimm143>

## Next Up:

- Overview of structural bioinformatics
  - Motivations, goals and challenges
- Fundamentals of protein structure
  - Structure composition, form and forces
- Representing, interpreting & modeling protein structure
  - Visualizing and interpreting protein structures
  - Analyzing protein structures
  - Modeling energy as a function of structure
  - Drug discovery & Predicting functional dynamics

## Key concept:

Potential functions describe a systems energy as a function of its **structure**

Two main approaches:  
(1). Physics-Based  
(2). Knowledge-Based

Two main approaches:

- (1). Physics-Based
- (2). Knowledge-Based

For **physics** based potentials  
energy terms come from physical theory

$$V(R) = E_{\text{bonded}} + E_{\text{non.bonded}}$$

$$V(R) = E_{\text{bonded}} + E_{\text{non.bonded}}$$

Sum of **bonded** and **non-bonded**  
atom-type and position based terms

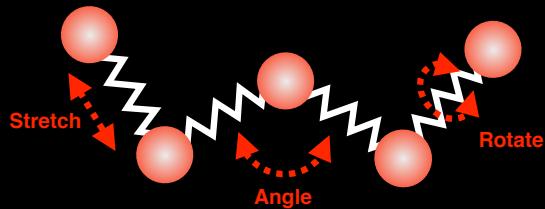

$$V(R) = \boxed{E_{\text{bonded}}} + E_{\text{non.bonded}}$$

$E_{\text{bonded}}$  is itself a sum of three terms:

$$V(R) = [E_{bonded}] + E_{non.bonded}$$

$E_{bonded}$  is itself a sum of three terms:

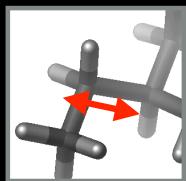

$$E_{bond.stretch} + E_{bond.angle} + E_{bond.rotate}$$

$$V(R) = [E_{bonded}] + E_{non.bonded}$$

$E_{bonded}$  is itself a sum of three terms:

$$E_{bond.stretch} + E_{bond.angle} + E_{bond.rotate}$$

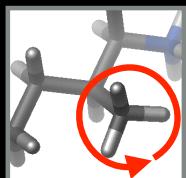

Bond Stretch

$$E_{bond.stretch}$$

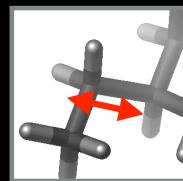

Bond Angle

$$E_{bond.angle}$$

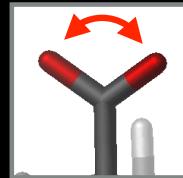

Bond Rotate

$$E_{bond.rotate}$$

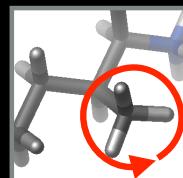

Bond Stretch

$$\sum_{bonds} K_i^{bs}(b_i - b_o)$$

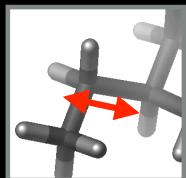

Bond Angle

$$\sum_{angles} K_i^{ba}(\theta_i - \theta_o)$$

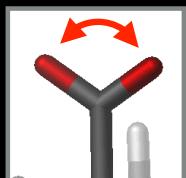

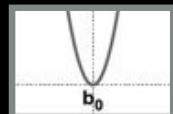

Bond Rotate

$$\sum_{dihedrals} K_i^{br}[1 - \cos(n_i\phi_i - \phi_o)]$$

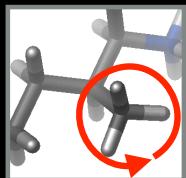

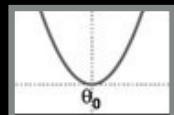

Bond Stretch

$$\sum_{bonds} K_i^{bs}(b_i - b_o)$$

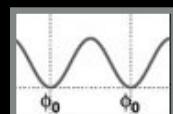

Bond Angle

$$\sum_{angles} K_i^{ba}(\theta_i - \theta_o)$$

Bond Rotate

$$\sum_{dihedrals} K_i^{br}[1 - \cos(n_i\phi_i - \phi_o)]$$

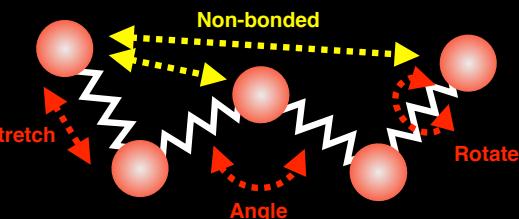

$$V(R) = E_{bonded} + E_{non.bonded}$$

$E_{non.bonded}$  is a sum of two terms:

$$V(R) = E_{bonded} + E_{non.bonded}$$

$E_{non.bonded}$  is a sum of two terms:

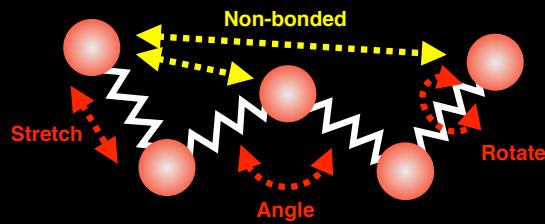

$$E_{van.der.Waals} + E_{electrostatic}$$

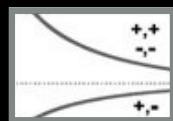

$$V(R) = E_{bonded} + E_{non.bonded}$$

$E_{non.bonded}$  is a sum of two terms:

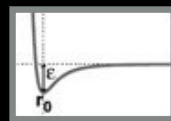

$$E_{van.der.Waals} + E_{electrostatic}$$

$$E_{\text{electrostatic}} = \sum_{\text{pairs}, i,j} \frac{q_i q_j}{\epsilon r_{ij}}$$

$$E_{\text{van.der.Waals}} = \sum_{\text{pairs}, i,j} \left[ \epsilon_{ij} \left( \frac{r_{o,ij}}{r_{ij}} \right)^{12} - 2 \epsilon_{ij} \left( \frac{r_{o,ij}}{r_{ij}} \right)^6 \right]$$

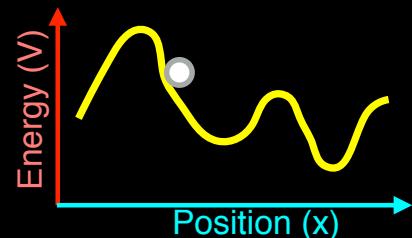

## Total potential energy

The potential energy can be given as a sum of terms for: Bond stretching, Bond angles, Bond rotations, van der Walls and Electrostatic interactions between atom pairs

$$\begin{aligned} V(R) = & E_{\text{bond.stretch}} \\ & + E_{\text{bond.angle}} \\ & + E_{\text{bond.rotate}} \\ & + E_{\text{van.der.Waals}} \\ & + E_{\text{electrostatic}} \end{aligned} \quad \left. \begin{array}{l} \\ \\ \\ \} \\ \} \end{array} \right. \begin{array}{l} E_{\text{bonded}} \\ E_{\text{non.bonded}} \end{array}$$

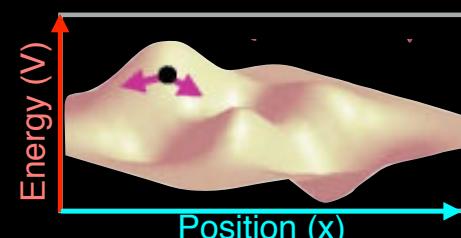

## Potential energy surface

Now we can calculate the **potential energy surface** that fully describes the energy of a molecular system as a function of its geometry

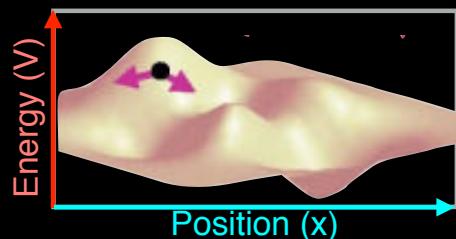

## Potential energy surface

Now we can calculate the **potential energy surface** that fully describes the energy of a molecular system as a function of its geometry

# Key concept:

Now we can calculate the **potential energy surface** that fully describes the energy of a molecular system as a function of its geometry

- The **forces** are the gradients of the energy  
 $F(x) = - dV/dx$

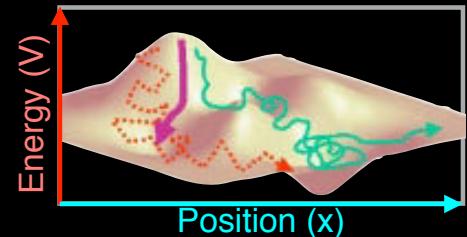

## Moving Over The Energy Surface

- Energy Minimization** drops into local minimum

- Molecular Dynamics** uses thermal energy to move smoothly over surface

- Monte Carlo Moves** are random. Accept with probability:

$$\exp(-\Delta V/dx)$$

## PHYSICS-ORIENTED APPROACHES

### Weaknesses

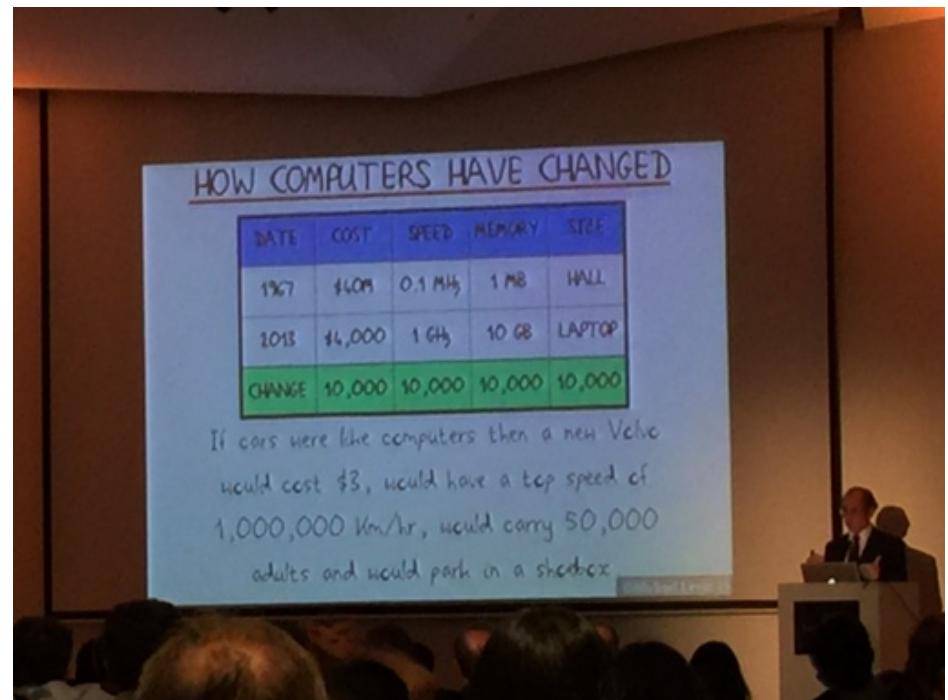

Fully physical detail becomes computationally intractable  
Approximations are unavoidable  
(Quantum effects approximated classically, water may be treated crudely)  
Parameterization still required

### Strengths

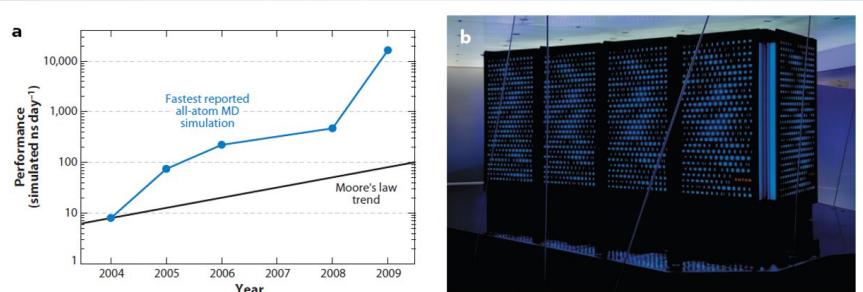

Interpretable, provides guides to design  
Broadly applicable, in principle at least  
Clear pathways to improving accuracy

### Status

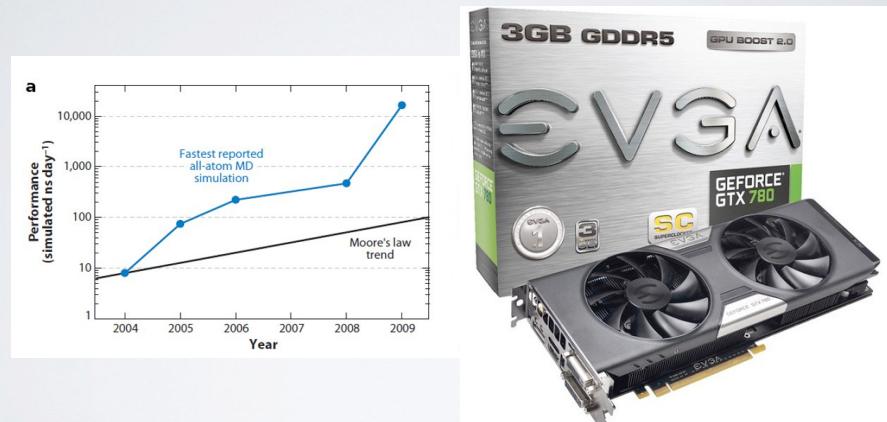

Useful, widely adopted but far from perfect  
Multiple groups working on fewer, better approxs  
Force fields, quantum entropy, water effects  
Moore's law: hardware improving

## SIDE-NOTE: GPUS AND ANTON SUPERCOMPUTER

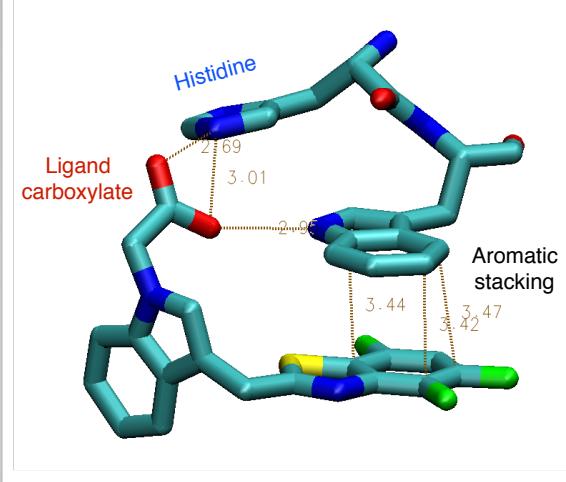

## SIDE-NOTE: GPUS AND ANTON SUPERCOMPUTER

POTENTIAL FUNCTIONS DESCRIBE A SYSTEMS  
**ENERGY** AS A FUNCTION OF ITS **STRUCTURE**

Two main approaches:  
(1). Physics-Based  
(2). Knowledge-Based

## KNOWLEDGE-BASED DOCKING POTENTIALS

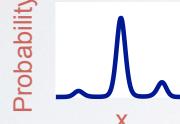

## ENERGY DETERMINES **PROBABILITY** (STABILITY)

Basic idea: Use probability as a proxy for energy

Boltzmann:  
 $p(r) \propto e^{-E(r)/RT}$

Inverse Boltzmann:  
 $E(r) = -RT \ln[p(r)]$

Example: ligand carboxylate O to protein histidine N

Find all protein-ligand structures in the PDB with a ligand carboxylate O  
1. For each structure, histogram the distances from O to every histidine N  
2. Sum the histograms over all structures to obtain  $p(r_{O-N})$   
3. Compute  $E(r_{O-N})$  from  $p(r_{O-N})$

## KNOWLEDGE-BASED POTENTIALS

### Weaknesses

Accuracy limited by availability of data

### Strengths

Relatively easy to implement  
Computationally fast

### Status

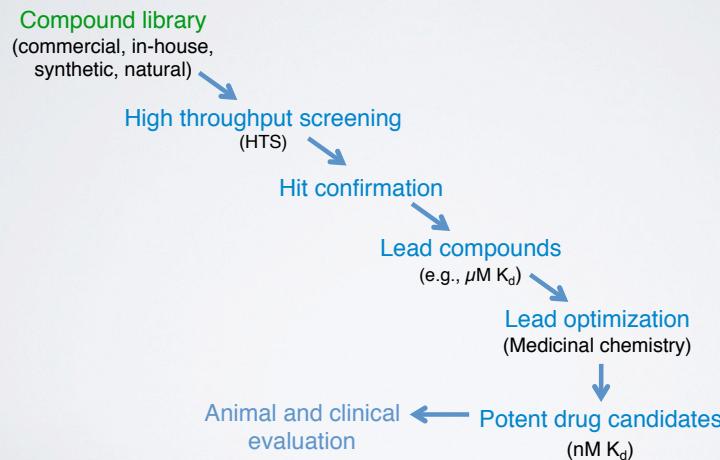

Useful, far from perfect  
May be at point of diminishing returns  
(not always clear how to make improvements)

# Computer Aided Drug Discovery

## Next Up:

- Overview of structural bioinformatics
  - Motivations, goals and challenges
- Fundamentals of protein structure
  - Structure composition, form and forces
- Representing, interpreting & modeling protein structure
  - Visualizing and interpreting protein structures
  - Analyzing protein structures
  - Modeling energy as a function of structure
- Drug discovery & Predicting functional dynamics

## THE TRADITIONAL EMPIRICAL PATH TO DRUG DISCOVERY

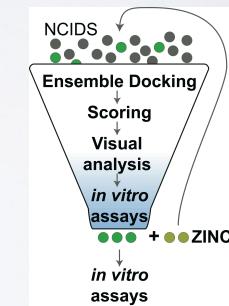

## COMPUTER-AIDED LIGAND DESIGN

Aims to reduce number of compounds synthesized and assayed

Lower costs

Reduce chemical waste

Facilitate faster progress

Two main approaches:

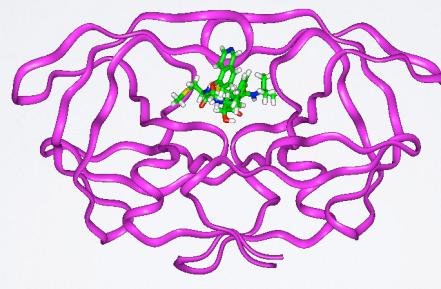

- (1). Receptor/Target-Based
- (2). Ligand/Drug-Based

Two main approaches:

- (1). Receptor/Target-Based
- (2). Ligand/Drug-Based

## SCENARIO I: RECEPTOR-BASED DRUG DISCOVERY

Structure of Targeted Protein Known: Structure-Based Drug Discovery

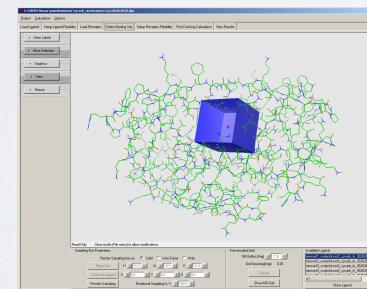

HIV Protease/KNI-272 complex

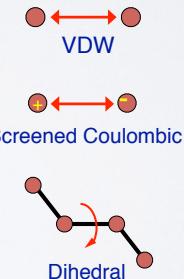

## PROTEIN-LIGAND DOCKING

Structure-Based Ligand Design

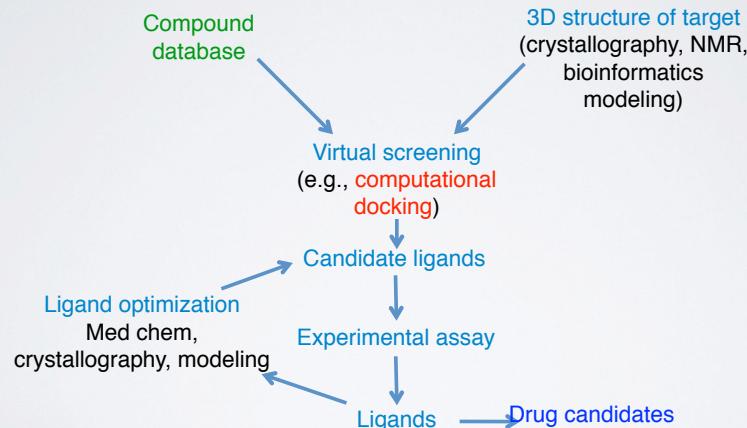

Docking software  
Search for structure of lowest energy

Potential function  
Energy as function of structure

## STRUCTURE-BASED VIRTUAL SCREENING

## COMPOUND LIBRARIES

Commercial  
(in-house pharma)

Government (NIH)

Academia

## COMMON SIMPLIFICATIONS USED IN PHYSICS-BASED DOCKING

Quantum effects approximated classically

Protein often held rigid

Configurational entropy neglected

Influence of water treated crudely

Do it Yourself!

## Hand-on time!

[https://bioboot.github.io/bimm143\\_S19/lectures/#13](https://bioboot.github.io/bimm143_S19/lectures/#13)

You can use the classroom computers or your own laptops. If you are using your laptops then you will need to install **MGLTools**

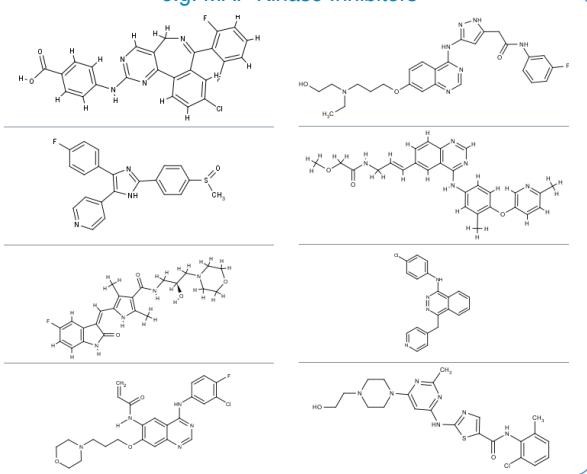

Two main approaches:

- (1). Receptor/Target-Based
- (2). Ligand/Drug-Based

## Scenario 2

Structure of Targeted Protein Unknown:  
Ligand-Based Drug Discovery

e.g. MAP Kinase Inhibitors

Using knowledge of existing inhibitors to discover more

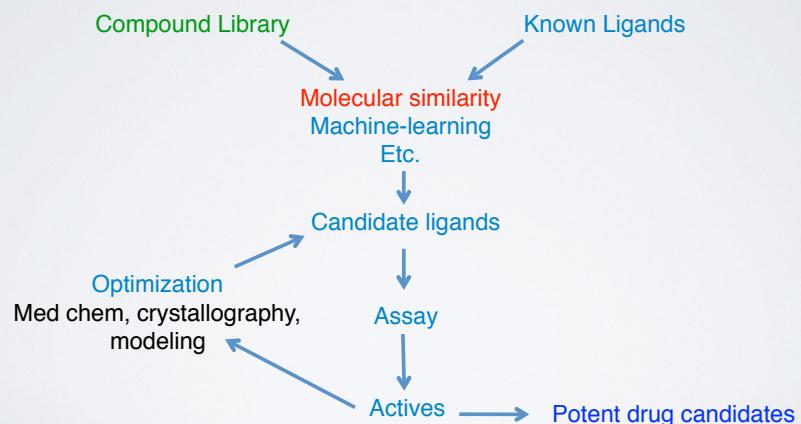

## Why Look for Another Ligand if You Already Have Some?

Experimental screening generated some ligands, but they don't bind tightly enough

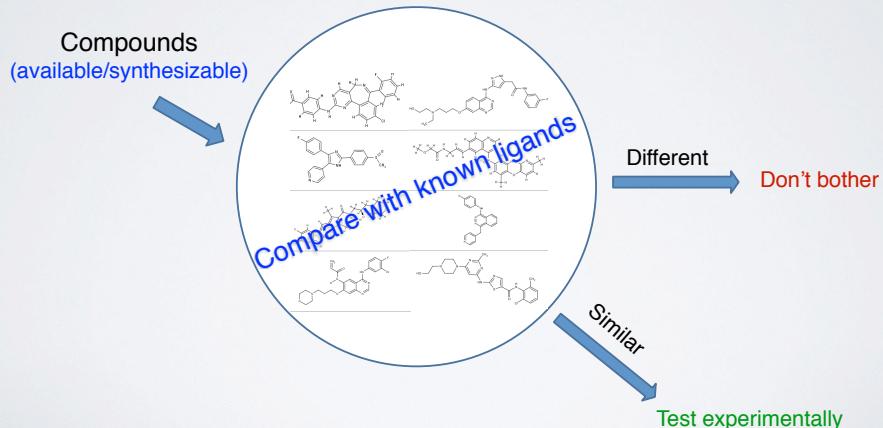

A company wants to work around another company's chemical patents

An high-affinity ligand is toxic, is not well-absorbed, difficult to synthesize etc.

## LIGAND-BASED VIRTUAL SCREENING

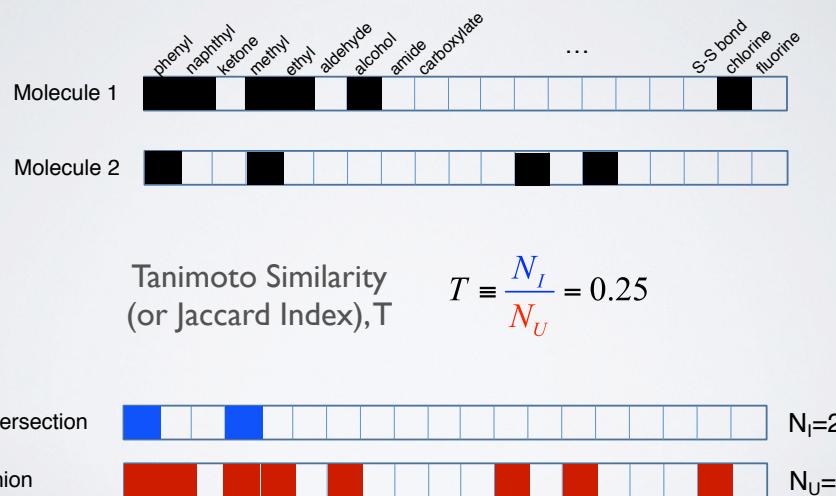

## CHEMICAL SIMILARITY LIGAND-BASED DRUG-DISCOVERY

## CHEMICAL FINGERPRINTS BINARY STRUCTURE KEYS

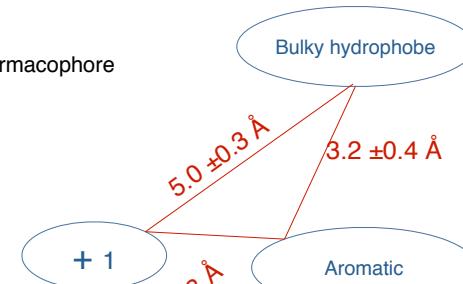

## CHEMICAL SIMILARITY FROM FINGERPRINTS

**Pharmacophore Models**  
Φάρμακο (drug) + Φορά (carry)

A 3-point pharmacophore

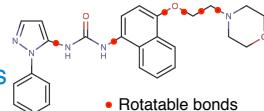

## Molecular Descriptors

More abstract than chemical fingerprints

### Physical descriptors

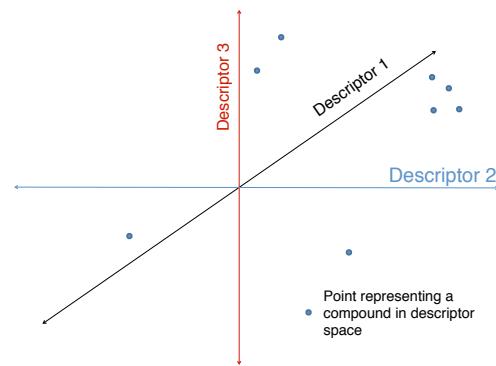

- molecular weight
- charge
- dipole moment
- number of H-bond donors/acceptors
- number of rotatable bonds
- hydrophobicity (log P and clogP)

- Topological branching index
- measures of linearity vs interconnectedness

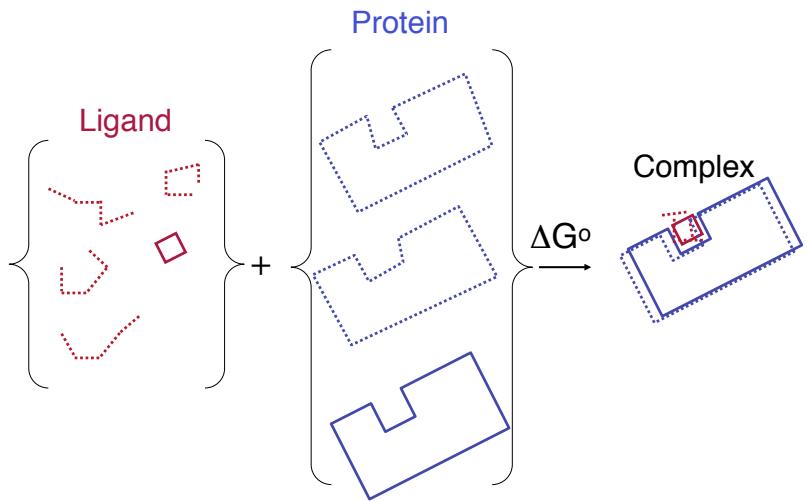

Etc. etc.

**A High-Dimensional “Chemical Space”**  
Each compound is a point in an n-dimensional space  
Compounds with similar properties are near each other

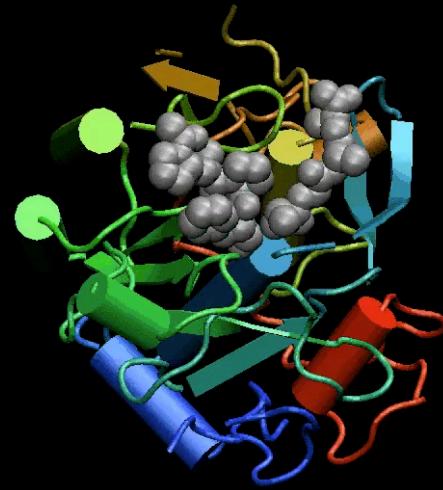

Apply multivariate statistics and machine learning for descriptor-selection. (e.g. partial least squares, PCA, support vector machines, random forest, deep learning etc.)

## Proteins and Ligand are Flexible

NMA (Normal Mode Analysis) is a bioinformatics method to predict the intrinsic dynamics of biomolecules

Do it Yourself!

[https://bioboot.github.io/bimm143\\_S19/lectures/#12](https://bioboot.github.io/bimm143_S19/lectures/#12)

## NMA in Bio3D

- Normal Mode Analysis (NMA) is a bioinformatics method that can predict the major motions of biomolecules.

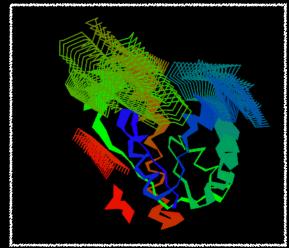

```
pdb <- read.pdb("1hel")
modes <- nma(pdb)
m7 <- mktrj(modes, mode=7, file="mode_7.pdb")
```

Then you can open the resulting `mode_7.pdb` file in VMD  
> Use "TUBE" representation and hit the play button...

```
view(m7, col=vec2color(rmsf(m7)))
````
```

## Bio3D view()

- If you want the 3D viewer in your R markdown you can install the development version of `bio3d.view`

- In your R console:

```
> install.packages("devtools")
> devtools::install_bitbucket("Grantlab/bio3d-view")
> install.packages("rgl")
```

- To use in your R session:

```
> library("bio3d.view")
> pdb <- read.pdb("5p21")
> view(pdb)
> view(pdb, "overview", col="sse")
> view(m7)
```

# SideNote: `view()`

- If you want the interactive 3D viewer in **Rmd** rendered to **output: html\_output** document:

```
```{r}
library(bio3d.view)
library(rgl)
````
```

```
```{r}
modes <- nma( read.pdb("1hel") )
m7 <- mktrj(modes, mode=7, file="mode_7.pdb")

view(m7, col=vec2color(rmsf(m7)))
rglwidget(width=500, height=500)
````
```

Do it Yourself!

## Hand-on time!

[https://bioboot.github.io/bimm143\\_S19/lectures/#13](https://bioboot.github.io/bimm143_S19/lectures/#13)

Focus on **section 3 & 4** exploring **NMA** and **PCA apps**

# Reference Slides

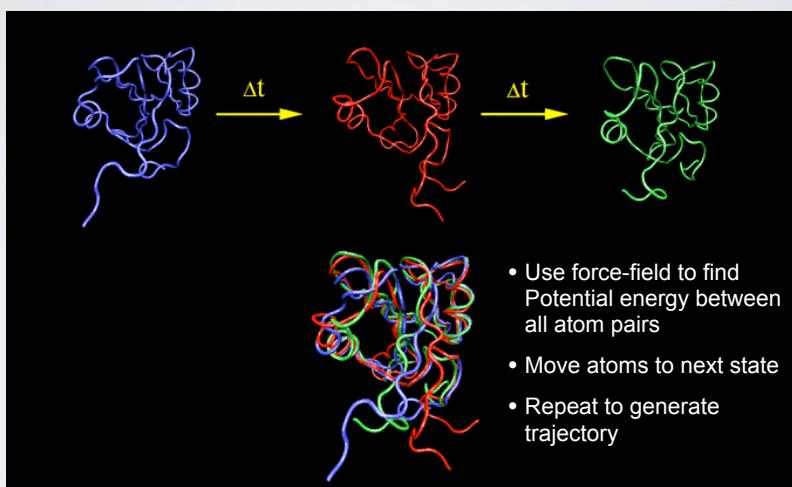

Molecular Dynamics (MD) and Normal Mode Analysis (NMA) Background and Cautionary Notes

[ [Muddy Point Assessment](#) ]

## PREDICTING FUNCTIONAL DYNAMICS

- Proteins are intrinsically flexible molecules with internal motions that are often intimately coupled to their biochemical function
  - E.g. ligand and substrate binding, conformational activation, allosteric regulation, etc.
- Thus knowledge of dynamics can provide a deeper understanding of the mapping of structure to function
  - Molecular dynamics (MD) and normal mode analysis (NMA) are two major methods for predicting and characterizing molecular motions and their properties

## MOLECULAR DYNAMICS SIMULATION

McCammon, Gelin & Karplus, *Nature* (1977)  
 [ See: <https://www.youtube.com/watch?v=uI1ZysMFcKk> ]

- ▷ Divide time into discrete (~1fs) time steps ( $\Delta t$ )  
 (for integrating equations of motion, see below)

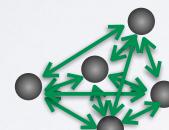

- ▷ Divide time into discrete (~1fs) time steps ( $\Delta t$ )  
 (for integrating equations of motion, see below)

- ▷ Divide time into discrete (~1fs) time steps ( $\Delta t$ )  
 (for integrating equations of motion, see below)

- ▷ At each time step calculate pair-wise atomic forces ( $F(t)$ )  
 (by evaluating force-field gradient)

**Nucleic motion described classically**

$$m_i \frac{d^2}{dt^2} \vec{R}_i = -\vec{\nabla}_i E(\vec{R})$$

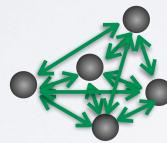

**Empirical force field**

$$E(\vec{R}) = \sum_{\text{bonded}} E_i(\vec{R}) + \sum_{\text{non-bonded}} E_i(\vec{R})$$

- Divide time into discrete (~1fs) time steps ( $\Delta t$ )  
(for integrating equations of motion, see below)

- At each time step calculate pair-wise atomic forces ( $F(t)$ )  
(by evaluating force-field gradient)

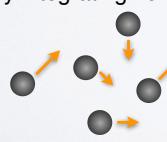

*Nucleic motion described classically*

$$m_i \frac{d^2}{dt^2} \vec{R}_i = -\vec{\nabla}_i E(\vec{R})$$

*Empirical force field*

$$E(\vec{R}) = \sum_{\text{bonded}} E_i(\vec{R}) + \sum_{\text{non-bonded}} E_i(\vec{R})$$

- Use the forces to calculate velocities and move atoms to new positions  
(by integrating numerically via the “leapfrog” scheme)

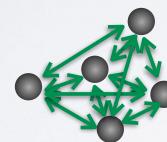

$$\begin{aligned} v(t + \frac{\Delta t}{2}) &= v(t - \frac{\Delta t}{2}) + \frac{F(t)}{m} \Delta t \\ r(t + \Delta t) &= r(t) + v(t + \frac{\Delta t}{2}) \Delta t \end{aligned}$$

## BASIC ANATOMY OF A MD SIMULATION

- Divide time into discrete (~1fs) time steps ( $\Delta t$ )  
(for integrating equations of motion, see below)

- At each time step calculate pair-wise atomic forces ( $F(t)$ )  
(by evaluating force-field gradient)

*Nucleic motion described classically*

$$m_i \frac{d^2}{dt^2} \vec{R}_i = -\vec{\nabla}_i E(\vec{R})$$

*Empirical force field*

$$E(\vec{R}) = \sum_{\text{bonded}} E_i(\vec{R}) + \sum_{\text{non-bonded}} E_i(\vec{R})$$

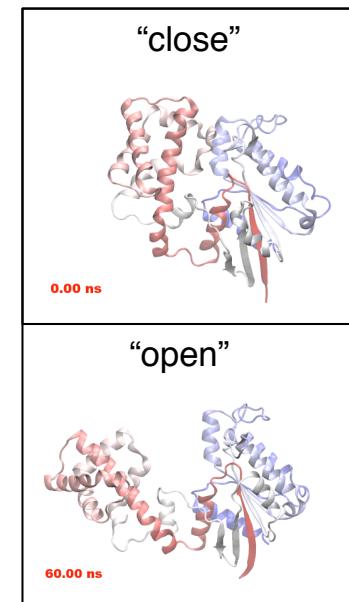

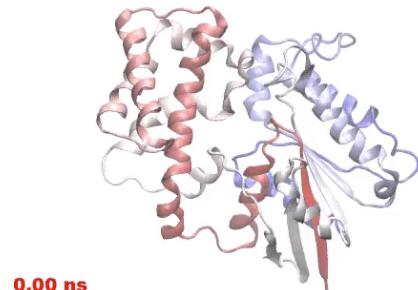

- Use the forces to calculate velocities and move atoms to new positions  
(by integrating numerically via the “leapfrog” scheme)

$$\begin{aligned} v(t + \frac{\Delta t}{2}) &= v(t - \frac{\Delta t}{2}) + \frac{F(t)}{m} \Delta t \\ r(t + \Delta t) &= r(t) + v(t + \frac{\Delta t}{2}) \Delta t \end{aligned}$$

## MD Prediction of Functional Motions

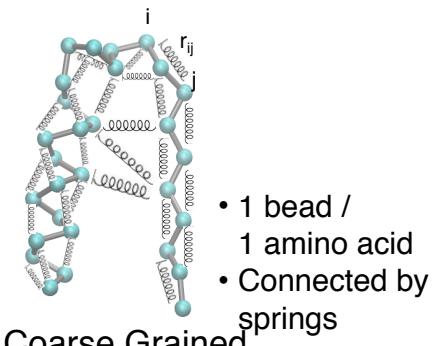

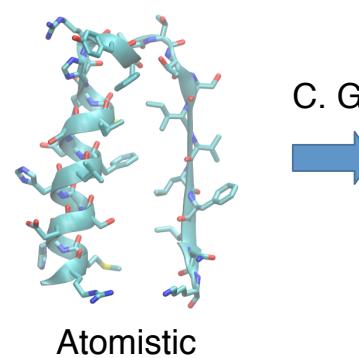

Accelerated MD simulation of nucleotide-free transducin alpha subunit

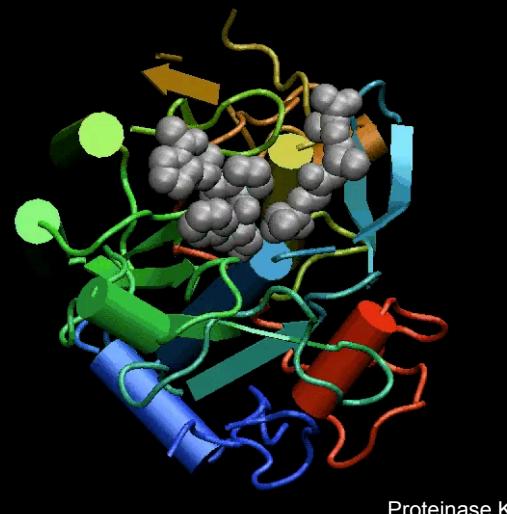

Yao and Grant, Biophys J. (2013)

## COARSE GRAINING: NORMAL MODE ANALYSIS (NMA)

- MD is still time-consuming for large systems
- Elastic network model NMA (ENM-NMA) is an example of a lower resolution approach that finishes in seconds even for large systems.

NMA models the protein as a network of elastic strings

Proteinase K

Do it Yourself!

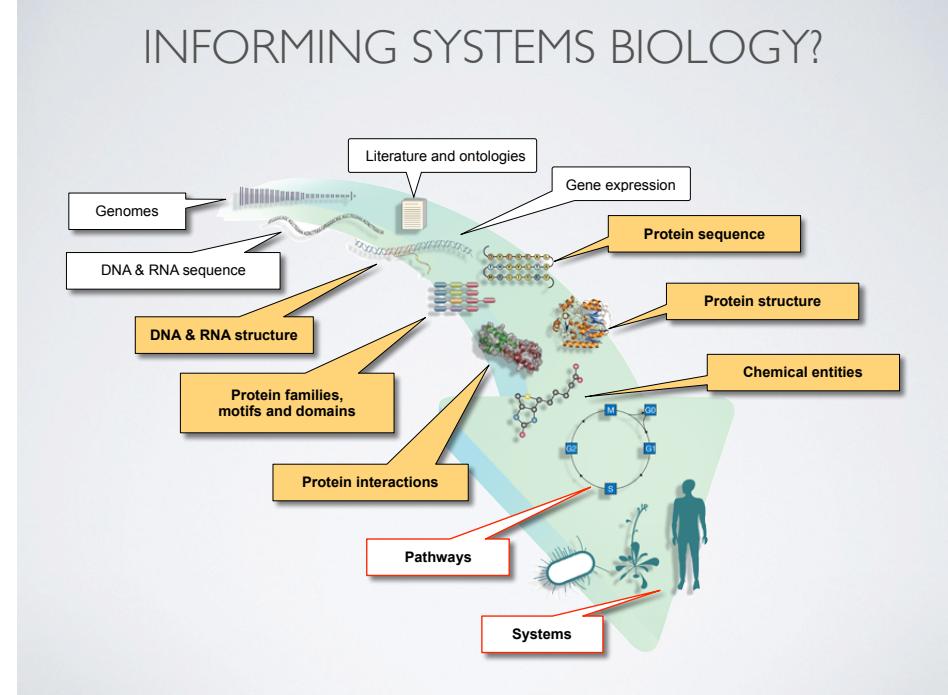

## Hand-on time!

Focus on **section 3 & 4** exploring **NMA** and **PCA apps**

Ilan Samish et al. Bioinformatics 2015;31:146-150

## SUMMARY

- Structural bioinformatics is computer aided structural biology
- Described major motivations, goals and challenges of structural bioinformatics
- Reviewed the fundamentals of protein structure
- Explored how to visualize protein structure with VMD and use R to perform more advanced structural bioinformatics analysis!
- Introduced both physics and knowledge based modeling approaches for describing the structure, energetics and dynamics of proteins computationally
- Introduced both structure and ligand based bioinformatics approaches for drug discovery and design

[ [Muddy Point Assessment](#) ]

## CAUTIONARY NOTES

- A model is never perfect  
A model that is not quantitatively accurate in every respect does not preclude one from establishing results relevant to our understanding of biomolecules as long as the biophysics of the model are properly understood and explored.
- Calibration of parameters is an ongoing imperfect process  
Questions and hypotheses should always be designed such that they do not depend crucially on the precise numbers used for the various parameters.
- A computational model is rarely universally right or wrong  
A model may be accurate in some regards, inaccurate in others. These subtleties can only be uncovered by comparing to all available experimental data.
